14. Consider a 100 g sample.

| Element | $\boldsymbol{n}=\frac{\boldsymbol{m}}{\boldsymbol{m}}$ (mol) | Ratio to Smallest $\boldsymbol{n}$ | Revised Ratio |
| :---: | :---: | :---: | :---: |
| C | $\frac{80.2}{12.01}=6.677$ | 10.498 | 21 |
| 0 | $\frac{10.18}{16.00}=0.636$ | 1.00 | 2 |
| H | $\frac{9.62}{1.01}=9.524$ | 14.975 | 30 |

The empirical formula is $\mathrm{C}_{21} \mathrm{O}_{2} \mathrm{H}_{30}$.
15. Consider a 100 g sample.

| Element | $\boldsymbol{n}=\frac{\boldsymbol{m}}{\boldsymbol{M}}$ (mol) | Ratio to Smallest $\boldsymbol{n}$ | Revised Ratio |
| :---: | :---: | :---: | :---: |
| Na | $\frac{17.6}{22.99}=0.766$ | 1.00 | 2 |
| Cr | $\frac{39.7}{52.00}=0.763$ | 1.00 | 2 |
| 0 | $\frac{42.8}{16.00}=2.675$ | 3.50 | 7 |

The empirical formula is $\mathrm{Na}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}$.
21. Mass of $\mathrm{FeSO}_{4} \cdot x \mathrm{H}_{2} \mathrm{O}=2.78 \mathrm{~g}$

Mass of $\mathrm{FeSO}_{4}=1.52 \mathrm{~g}$
Mass of $\mathrm{H}_{2} \mathrm{O}$ in sample $=2.78 \mathrm{~g}-1.52 \mathrm{~g}=1.26 \mathrm{~g}$
Moles of $\mathrm{FeSO}_{4}=\frac{1.52 \mathrm{~g}}{151.92 \mathrm{~g} / \mathrm{mol}}$ $=0.01 \mathrm{~mol} \mathrm{FeSO}_{4}$

Moles of $\mathrm{H}_{2} \mathrm{O}=\frac{1.26 \mathrm{~g}}{18.02 \mathrm{~g} / \mathrm{mol}}$

$$
=0.07 \mathrm{~mol} \mathrm{H}_{2} \mathrm{O}
$$

Divide moles of iron sulfate and water by 0.01 mol , this gives the ratio $1 \mathrm{~mol} \mathrm{FeSO}_{4}: 7 \mathrm{~mol} \mathrm{H}_{2} \mathrm{O}$
Therefore, $x=7$ and the formula for the compound is $\mathrm{FeSO}_{4} \cdot 7 \mathrm{H}_{2} \mathrm{O}$.
